The voltage of a car battery is a measurement of the electrical potential difference between the positive and negative terminals of the battery. A fully charged car battery typically measures around 12.6 volts, with a normal voltage range of 12.4 to 12.7 volts.. It is important to note that the voltage of a car battery can vary depending on several factors.

To charge a 12 volt battery, you need to use a battery charger that is designed for that specific type of battery. The charging voltage should be between 10% and 25% of the battery's capacity. For example, if you have a 12 volt 100Ah battery, you should use a charger that can provide a minimum of 10 amps and a maximum of 20-25 amps.

That's not enough to drain a healthy 12V automotive battery from 12.3V to 11.2V in only five minutes. Instead what's happening is that when the battery is charged, that includes "surface charge", which gives the illusion of a higher charge on the battery than there really is. (See e.g.

You may consider a battery that's 1500 mAh or more. Get a good charger as well. Voltage. Once you know the battery capacity you need, check the voltage as well. Many LiPo batteries are 7.4 Volt or 11.1 Volt. Li-ION / NiMH batteries are around 8.4 Volt or 9.6 Volt. Pick a blaster battery that suits your blaster's specifications.

28-volt Lithium-Ion battery packs power the entire Milwaukee M28 System of power tools. The V28 Lithium-Ion battery pack offers up to twice the run-time of an 18-volt NiCd or NiMH pack and is actually lighter than 18-volt NiCd and NiMH packs! Lithium-Ion technology allows consistent fade-free power meaning the first cut is as powerful as the last.
