Since capacitors have a leading power factor, and reactive power is not a constant power, designing a capacitor bank must consider different reactive power needs. For example, the configuration for a 5-stage capacitor bank with a 170 KVAR maximum reactive power rating could be 1:1:1:1:1, meaning 5*34 KVAR or 1:2:2:4:8 with 1 as 10 KVAR.

The direction of reactive power flow can be reversed by making $V_2 > V_1$. The magnitude of reactive power flow is determined by the voltage difference between point A and B. When R is ignored, the reactive power flow, Q is given by the following formula: $Q = V_2 (V_1 - V_2) / X$. The ideal situation is when $V_1 = V_2$, and reactive power flow is ...
