Discharge time is basically the Ah or mAh rating divided by the current. So for a 2200mAh battery with a load that draws 300mA you have: $\frac{2.2}{0.3} = 7.3$ hours * The charge time depends on the battery chemistry and the charge current. For NiMh, for

In this case, the discharge rate is given by the battery capacity (in Ah) divided by the number of hours it takes to charge/discharge the battery. For example, a battery capacity of 500 Ah that is theoretically discharged to its cut-off voltage in 20 hours will have a ...

Even when there isn't a load attached to a battery, it is still losing charge. It's known as self-discharge. Every battery chemistry has a unique self-discharge rate, though. The ambient temperature has a significant impact on the self-discharge rate since it causes

· Current Impact Series connection doesn't affect the current. The same current flows through all the batteries. · Circuit Influence In a series setup, circuit break interrupts the entire chain, stopping power flow. · ...
