Typically, the battery charging process requires both constant current (CC) and constant voltage (CV), with both CC and CV charging processes contributing to extending the battery's overall life cycle [5, 6].

Generating steep, pulsed heavy currents with a high stability flat-top on a highly inductive load is a challenging task. This is due to the voltage of the current rising tens of times higher than that of the stable current, and the load resistance undergoing nonlinear changes caused by Joule heat. Hence a hybrid power supply, which includes the cooperative ...
