It can be divided into many subcategories, such as thermal and chemical energy, and depends only on the state of a system (that is, P, V, and T), not on how the energy enters or leaves the system. In order to understand the relationship between heat, work, and internal energy, we use the first law of thermodynamics .

Thermal Energy is a component of internal energy, but is unrelated to the vibrational and rotational energy of a solid's atoms. Instead, Thermal Energy occurs from atoms' translational motion. When we say &quot;change of thermal energy,&quot; we mean that it is the part of the internal energy that is associated with a Temperature change.
