But the reality is that there are many subtleties in these ubiquitous, passive components. Depending on the battery function, size and, most critically, its chemistry, they can be safe and easy to use, or a serious chemical or fire risk. (Note that the terms "battery" and "cell" are often used interchangeably.

This short video gives an overview about the general safety hazards and concerns of lithium-ion batteries and highlights briefly about UL's Battery Safety research initiatives.

The Science of Fire and Explosion Hazards from Lithium-Ion Batteries sheds light on lithium-ion battery construction, the basics of thermal runaway, and potential fire and explosion hazards. This ...

A truck sitting is draining the battery. Then they drive short drives, which doesn't adequately charge the battery. And it was very cold, draining the battery further. Running the hazards for 45 minutes off a very low battery could in fact kill it IMO. You had the battery tested, so try to drive it more or get a Battery Tender.
