Battery cell assembly. 4.1 Winding or Stacking. The next step is assembling the battery cells. There are two primary methods: Winding: The anode and cathode foils, separated by a porous film, are wound into a jelly-roll configuration. Stacking: Stack the anode, separator, and cathode layers in a flat, layered structure.

Winding carries current from the battery, Due to the current magnetic field produced around the winding. 5) Battery: The battery supplies the current to the winding. 6] Clutch Switch: A clutch switch is used to On/Off the current supply to winding. In the engaged position, the clutch switch is Off hence current flows from winding.

Every part is essential to the battery's overall function, and research is always being done to improve these parts even more. Understanding the detailed structure of lithium-ion batteries helps appreciate their complexity and the engineering challenges involved in their development and optimization. III. Working Principle of Lithium-ion Batteries
