Solid-state batteries (SSBs) currently attract great attention as a potentially safe electrochemical high-energy storage concept. However, several issues still prevent SSBs from outperforming today's lithium-ion batteries based on liquid electrolytes.

With the development of the times, the energy demand is increasingly severe. These new demands require that the energy density of the battery system is much higher than the currently available energy density, which will inevitably lead to the traditional lithium-ion battery technology that can no longer meet the demand [1, 2]. One of the most promising ...

Because galvanic cells can be self-contained and portable, they can be used as batteries and fuel cells. A battery (storage cell) is a galvanic cell (or a series of galvanic cells) that contains all the reactants needed to produce electricity. In contrast, a fuel cell is a galvanic cell that requires a constant external supply of one or more reactants to generate electricity.
