Choosing the appropriate battery charging current is critical to achieving optimal battery performance, ultimately helping to extend shelf life according to recommended guidelines. Careful handling of batteries is an important practice in this regard. What are the potential uses for accurately measuring battery charging current

The battery has gone bad. When the car battery is dying, it won't be able to maintain the charge. This can cause the car's voltage meter to fluctuate. Since it's a problem with the battery, you could replace that and see if that corrects the problem.

It just means the current fluctuates. When cruising down the road the battery voltage stabilizes as does the regulator and with nothing switching in or out the ammeter current is stable. The original regulators have mechanical contacts that are either open or closed so the current they call for is in a series of steps.

As discussed later, float current is nearly always changing (float current fluctuations are often referred to as AC Ripple noise). As a result, the only way to obtain an accurate current ...

During the absorption stage (sometimes called the "equalization stage"), the remaining 20% of the charging is completed. During this stage, the controller will shift to constant voltage mode, maintaining the target charging voltage, typically between 14.1Vdc and 14.8Vdc, depending on the specific type of lead-acid battery being charged, while decreasing the ...

With the tow/haul feature enabled, the RVC system will stay in "Charge Mode" and the targeted generator output voltage will be 13.9-15.5 volts, depending on the battery state of charge and the estimated battery temperature. To keep the generator in the "Charge Mode", use either of the following two methods.

Thanks for the explanation! That supports what I've experienced: left yesterday from northern Mi to KY. Outdoor temps 0-25 with snow. All heating accessories on, battery was a constant 14+. Today in Alabama, outdoor temp 60, minimal accessories on, battery gauge at 11.5 - 14. Thought for sure I had a bad alternator! Very relieved! Thanks again!

Battery Charging and Amperage Fluctuations? Question: I have a video of my charger display while the engine is running. At 2000 rpm, it shows that the charging voltage is constant (14.19 for the starter battery and 14.28 for the house bank), but the amperage is fluctuating all over the place, from 9.2 to 11.8A, sometimes settling around 10.4, but then fluctuating again.

I prefer a digital meter. So I can see exactly what my battery is doing. My Ezgo is a 36 volt pds. Reads about 45 volts just before the charger cuts off. Then settles down to 38.5 . While climbing a steep hill it may drop as low as 33 volts. The instructions with the meter says to wait one minute after stopping to read the voltage.

How do you know the state of the battery before doing Test #1. What if it's shot and 1/2 hr of driving doesn't bring it to full charge. Testing a discharged batt will skew results. My recommendation was for the OP to charge the batt to be sure of a reliable starting point. A smart charger will have a nice green light to say you're at 100%.

Most modern laptops don't let you remove the battery, but if yours does, there's a trick you can try that sometimes resets the charging process. Remove the battery, unplug the charger, then press and hold the power button for 15 seconds. This resets the internal CMOS of the laptop, which can kick it out of whatever non-charging loop it's stuck in.

Typically, on-again-off-again charging happens because of a poor flow of electricity. These issues can be tied to your charging port/ power port, battery, or charger. If you're seeking to understand why your charger constantly switches on and off and discover solutions to address this issue, you've come to the appropriate location. Keep ...

If you can check the voltage at the battery (when your gauge is reading 9 volts) this may help point you in the right direction. If the battery reads around 12volts (12.5 - 14v engine running), I would suspect the gauge or something on that circuit. If the battery reads the same 9volts, I would suspect the battery or alternator.

It should be bringing your battery voltage back to full charge, and for a flooded type battery, that is around 12.6 volts. Once there, the alternator would stop charging, but the voltage meter in dash should register the actual battery voltage (or at least this is what I think). Hell, I know very little!!
