Let's say that this is a battery with 7Ahr capacity and that you want to draw 14A. You'll have to observe the 2C curve (2C means to discharge at  $7\text{Ahr} \times 2/\text{h} = 14\text{A}$ ). You'll note that this battery will drop to 9.5V-10V after about ...

The discharge circuit for each cell consists of a resistor (R) and the controlled N-MOSFET switch. The N-MOSFET has current source capability of 4A because of lower internal resistance and lower power dissipation. The device temperature stays below  $50^\circ\text{C}$  while functioning. The power resistor value maintains the discharge current of approximately 0.65A. In most ...

Lithium-ion Battery. A lithium-ion battery, also known as the Li-ion battery, is a type of secondary (rechargeable) battery composed of cells in which lithium ions move from the anode through an electrolyte to the cathode during discharge and back when charging.. Battery capacity refers to the amount of electricity released by the battery under a certain discharge system (under a certain discharge current  $I$ , discharge temperature  $T$ , discharge cut-off voltage  $V$ ), indicating the ability of the battery to store energy in Ah or C. Capacity is affected by many elements, such as discharge current, discharge temperature, ...

Discharge: In contrast, discharge occurs when the stored energy in the battery is released to power external devices or systems. During discharge, the chemical reactions within the battery cause electrons to flow from the negative electrode to the positive electrode through an external circuit, generating electrical current to power the load.
