o Self-discharge rate: The battery's self-discharge rate is the rate at which the battery loses its charge when it is not in use. If you have ever wondered why an electronic device does not turn on after a period of inactivity, this is because the battery self-discharged until the battery lost enough charge to no longer support device function.

A battery is an energy storage device in which the stored chemical energy is converted into electrical energy by reduction-oxidation. In principle, these are two electrochemical substances (anode and cathode) with different electrochemical voltage potentials, which are housed in a casing with electrolyte (see the figure on the right side).
