The PCS is the intermediary device between the storage element, typically large banks of (DC) batteries, and the (AC) power grid. AC/DC and DC/AC conversion takes place in the power conversion system (PCS). The energy flows into the batteries to charge them or is converted to AC from the battery storage and fed into the grid.

Within these energy storage solutions, the Power Conversion System (PCS) serves as the linchpin, managing the bidirectional flow of energy between the battery and the grid. This article explores the significance of PCS within BESS containers, its functionalities, and its impact on the overall efficiency and performance of energy storage systems.

Electrical energy from the charging station is converted into chemical energy in the lithium-ion battery. The conversion process causes heat and as a result power losses. Luckily, most electric car battery packs, Nissan LEAF aside, come with a thermal management system to reduce energy loss when the battery is heating up or cooling down.
