A battery is a device that stores chemical energy and converts it to electrical energy. The chemical reactions in a battery involve the flow of electrons from one material (electrode) to another, through an external circuit. The flow of electrons provides an electric current that can be used to do work.

Other commercial three-electrode cells such as Swagelok-style or split cell designs are costly and not practical to implement and scale, and can sometimes to complicated to build and use. Test results from these types of cells must also be normalized when comparing with traditional battery formats (coin, cylindrical, pouch, etc.).
