The analysis time required for the 9s9p battery module is 17 h, whereas 3s3p battery module analysis time is approximately 1 h. In order to reduce the computational time and resources, further analysis is carried out on the 3s3p battery module for evaluating PCM properties, which can be used as a scalable model for simulating larger packs.

That area-specific impedance (ASI) increase and power fades following (time) $1/2$ rule in the calendar life experiments may be due to SEI growth. From the cycle life experiments, the ASI increase data follow (time) $1/2$ kinetics also, but there is an apparent change when going from 2% to 6% D SOC. Here, the power of time drops to a value less than ...
