In this article, we take a look at the schematic diagram of a Li-Ion battery pack and breakdown its components and how it works. At the heart of every Li-Ion battery pack is the battery cells. Battery cells come in a variety of sizes and shapes, and are typically made up of a positive anode and a negative cathode connected together by an electrolyte solution.

This circuit eliminates the need for a special sensor because it senses the temperature of a soldering iron heating element directly from its resistance. Thus this circuit will, in principle, work with any iron with a resistance which varies predictably and in the right direction with temperature (ie, positive temperature coefficient).
