

## Battery percentage drops

If you don't go through your entire battery every day, charge primarily using lower power adapters, and so on, you might be able to go for three years before the battery health ends up at 80%. If you're really trying to take care of your battery, maybe you can get the wear down to 5% per year.

If the battery percentage on your Windows 11 laptop is wrong or inaccurate, here's what you can do to fix it.

A notification will appear about this. You can still use a device with a lower health percentage than 80% but for optimal usage you may wish to consider having it changed when it reaches 80% battery health. What this basically means: - If battery health drops a few percentage per month that is normal.

Referring to the "Your battery's maximum capacity" section of the support article: iPhone Battery and Performance - Apple Support - "A normal battery is designed to retain up to 80% of its original capacity at 500 complete charge cycles when operating under normal conditions." Apple apparently only considers it unusual (and covered by warranty) if a battery ...

Expand Battery, then expand Critical battery level. Take note of the current percentage for later. Click the On battery percentage and set it as low as possible. Expand Critical battery action and ensure that On battery is set to Hibernate. If it isn't, click to change it. Once done, click OK to save the changes. 2.

Apple defines an officially degraded battery as any one that contains less than 80 percent of its original battery capacity. A degraded battery will no longer be able to pump out the same amount of power as a fresh one. That can cause problems during times of peak power draw, such as when you're running CPU-intensive applications.

In my experience on my laptop, at higher loads, the battery will drop from higher percentage levels down to about 7%. However, under lighter loads, the battery might get to 15 ...
