Figure 1: Li-Ion Battery Diagram When a Li-ion battery is charging, positive lithium ions flow internally from the cathode to the anode; at the same time, electrons flow externally from the cathode to the anode. When the battery is discharging, the lithium ions and electrons flow in the opposite direction. Battery Parameters

The negative electrode is defined in the domain $-L_n \leq x \leq 0$; the electrolyte serves as a separator between the negative and positive materials on one hand ($0 \leq x \leq L_{SE}$), and at the same time transports lithium ions in the composite positive electrode ($L_{SE} \leq x \leq L_{SE} + L_p$); carbon facilitates electron transport in composite ...

Two types of solid solution are known in the cathode material of the lithium-ion battery. One type is that two end members are electroactive, such as $\text{LiCo}_x\text{Ni}_{1-x}\text{O}_2$, which is a solid solution composed of LiCoO_2 and LiNiO_2 . The other type has one electroactive material in two end members, such as LiNiO_2 - Li_2MnO_3
