battery is widely-adopted because of its high energy density on both a gravimetric and volumetric basis. To achieve longer system run-time and smaller size, more and more system designers are focusing on improving a system's power conversion efficiency with advanced circuit topologies through a better understanding of the battery characteristics.

Power Conversion: The traction inverter is responsible for converting the high-voltage DC power supplied by the vehicle's battery into AC power that can drive the electric motor. This process is crucial for controlling the speed and torque of the motor, enabling efficient and smooth vehicle operation.

This reference design is based on the dsPIC33F "GS" series of digital-power Digital Signal Controllers (DSCs).
