In order to protect your computer against power supply interruptions, you need a battery backup. UPS units are like power strips that contain a big battery inside, providing a buffer against power supply interruptions. This buffer can range from a few minutes to an hour or more depending on the size of the unit.

Before the spread of switched-mode technology, ferroresonant power supplies were the primary source of -48Vdc power in every telecommunication central office. A ferroresonant transformer consists of an auxiliary secondary winding with a parallel capacitive tank to provide a resonant circuit at the supply voltage frequency (Figure 1) .

A battery backup, aka UPS (Uninterruptible Power Supply), is a device that provides backup power and consistent electricity to a computer system. ... The rear of the UPS will feature one or more outlets that provide battery backup. In addition, many battery backup devices will also feature surge protection on additional outlets and sometimes ...

The voltage across the two resistors in parallel is the same: $[V_2 = V_3 = V - V_1 = 12.0, V - 2.35, V = 9.65, V.\text{nonumber}]$ Now we can find the current (I_2) through resistance (R_2) using Ohm's law: $[I_2 = \frac{V_2}{R_2} = \frac{9.65, V}{6.00, \Omega} = 1.61, A.\text{nonumber}]$ The current is less than the 2.00 A that flowed ...

3. A bi-polar output power supply (right) has two-quadrant operation; an SMU instrument (left) can source and sink power in all four quadrants.

An uninterruptible power supply (UPS), also known as a battery backup, provides backup power when your regular power source fails or voltage drops to an unacceptable level. A UPS allows for the safe, orderly shutdown of a computer and connected equipment. The size and design of a UPS determine how long it will supply power.
