When light shines on a photovoltaic (PV) cell - also called a solar cell - that light may be reflected, absorbed, or pass right through the cell. The PV cell is composed of semiconductor material; the "semi" means that it can conduct electricity better than an insulator but not as well as a good conductor like a metal.

Solar Panels: These panels, often mounted on top of the light fixture or nearby pole, capture sunlight and convert it into electricity through the photovoltaic effect. b. Battery Storage : Solar energy generated during the day is stored in rechargeable batteries to ensure continuous operation of the street lights during periods of low sunlight or at night.
