A capacitor is a device that stores electrical charge. The simplest capacitor is the parallel plates capacitor, which holds two opposite charges that create a uniform electric field between the plates.. Therefore, the energy in a capacitor comes from the potential difference between the charges on its plates.

Cell Energy Density. The calculations are quite simple as the energy content of the cell [Wh] = V nom x Ah nom. This value is then just divided by the volume of the cell to calculate volumetric energy density or divided by the mass of the cell to calculate the gravimetric energy density. There are some cautionary points though.
