The calculation is the same as Ahr but multiplied by the battery voltage. So the 10 Ah, 1.2 V NiMh battery is 10 Ah \* 1.2 V = 12 Whr. While the 10 Ah, 12 V Lead-Acid battery is 10 Ah \* 12 V = 120 Whr, 10 times more! We can do the reverse also, a 120 Whr battery at 12 V means it is 120 Whr / 12 V = 10 Ah.

The battery is packaged with polyimide tape and placed in the Accelerating Rate Calorimeter (ARC). The external power supply continuously heats the battery, and the temperature rise of the T-type thermocouples at both ends of the battery is recorded. The test results are shown in Table 2. 3.3. Electrochemical impedance spectroscopy tests and ...
