While ideal capacitors and inductors do not exhibit resistance, the voltage does react to the current. Unsurprisingly, we call this characteristic reactance and denote it with the letter (X). Reactance, like resistance, is a ratio of voltage to current. We define capacitive reactance as:  $[X_{C}] = frac\{v_c\}\{i_c\}$  label{1.7}]

Another popular type of capacitor is an electrolytic capacitor. It consists of an oxidized metal in a conducting paste. The main advantage of an electrolytic capacitor is its high capacitance relative to other common types of capacitors. For example, capacitance of one type of aluminum electrolytic capacitor can be as high as 1.0 F.
