Energy storage levels differ vastly for different applications. For example, 0.22 mF 400 V ignition capacitor stores just 0.02 Joules. Electrolytic capacitor of 2500 mF 450 V DC stores a huge 253 Joules, while Supercapacitor of 5000 F charged at 2.5 V stores 15,625 Joules, or 4.3 Watt-hours (Wh).

These tiny capacitors are not lacking in energy density, however -- they exhibit 9-times higher energy density and 170-times higher power density than even the best electrostatic capacitors. Using these miniaturized capacitors, energy storage and delivery could be built directly into individual microchips, greatly enhancing efficiency.
