A graph for the charging of the capacitor is shown in Fig. 3. Fig. 3 Charging of capacitor with respect to time. From the graph, it can be told that initially charging current will be maximum and the capacitor will begin to change rapidly, and after a one-time constant that is $T=RC$ capacitor will charge approximately 63% of its total value.

The capacitors charge, but where the first one is 3v (V_{in} is 3.3) and the second is a little below that, but not 6v as I would assume. I have not added a way yet to drain the second capacitor. I have also tried with optocoupler and was also unsuccessful, but that may be due to other reasons..

A capacitor is a device used to store electric charge. Capacitors have applications ranging from filtering static out of radio reception to energy storage in heart defibrillators.
