There are two main subtypes of "Y capacitor", "Y1" and "Y2" (with Y1 being the higher rated type). In general Y1 capacitors are used in class 2 equipment while Y2 capacitors are used in class 1 equipment.

If it were there to correct power factor, it would be there to counteract the inductive load of the transformer -- but the 20mA that the capacitor draws at 240V would be consistent with a transformer that's supplying at least 20W to the point of load, and possibly more if I'm misremembering my rules of thumb.

The primary winding is the coil in a transformer that is energized by the source. The secondary winding is the coil that is connected to the load. The primary circuit in a transformer can be the high-voltage or the low-voltage ...

Capacitive Voltage Transformers (CVTs) have been widely used within transmission power systems for applications ranging from high-voltage to ultra high-voltage.

A half-wave rectifier with transformer and capacitor is shown in Figure (PageIndex{6}). Figure (PageIndex{6}): Half-wave rectifier with transformer and filter capacitor. One way of looking at the inclusion of the smoothing capacitor is to consider that it, along with the load resistance, make up an (RC) discharge

Capacitive Voltage Transformer: Potential Transformer: This device consists of a stack of capacitors connected in a series of ways. The voltage at the capacitor is used for the calculation of the device voltage. It even helps the purpose of ...

A Y2 capacitor can safely be used in place of an X2 capacitor, but an X2 capacitor should not be used in place of a Y2 capacitor. This is because, although an X2-type capacitor would work and filter noise sufficiently, it would not meet the line-to-ground safety standards. Y2 safety capacitors are more robust, are able to withstand higher peak impulse ...

The capacitive potential transformer's voltage transformation ratio is unburdened. The load is something that the transformer's secondary winding is below. As the potential transformer is connected across the line to ground, the voltage across each capacitor is V_1 and V_2 , and the voltage across the entire line is $V_{line}/1.732$, or V_p .
