aluminum polymer capacitors may not be the optimal choice here. This is due to the property of the solid polymer because it cannot absorb vibrations as well as a liquid electrolyte. However, it has to be considered that in terms of volume for a defined capacity and voltage, the normal electrolytic capacitor still has advantages. At W&#252;rth Elektronik eiSos, for aluminium polymer ...

If it is the kind of "skinned" capacitor, it is necessary to pass this step to cover the surface of the capacitor with a PVC film on the surface of the capacitor aluminum shell. However, the current use of PVC film capacitors has become less and less, mainly because this material is not in line with the trend of environmental protection, and it does not have much to do with performance.

Aluminum electrolytic capacitors utilize an "anode" (+) electrode made of high-purity etched aluminum foil. The anode etching process increases the surface area of the foil by creating microscopic tubes. This gives AE caps their high capacitance. An aluminum oxide layer is formed (under voltage) on the anode which acts as the dielectric. Liquid electrolyte is in intimate ...
