Discharging Capacitor. Now suppose we take the capacitor that was charged in a circuit in Figure 5.10.1, disconnected from a battery, and connected to just to a resistor as shown in Figure 5.10.3 below. In this case electrons from the negatively charged plate will be attracted to the positive plate and flow accordingly.

As seen in the current-time graph, as the capacitor charges, the current decreases exponentially until it reaches zero. This is due to the forces acting within the capacitor increasing over time until they prevent electron flow.. The potential difference needs to increase over time exponentially as does charge.
