[Total: 3 Average: 4.7]Use of capacitor and reactive power compensation: In consumers such as electric motors, due to having a coiled wire, in addition to the active power that is taken from the network, some reactive power is also absorbed from the network, which does not play a role as the ...

Here X_C = capacitive reactance of the series capacitor bank per phase and X_L is the total inductive reactance of the line/phase. In practice, X_C may be so selected that the factor $(X_L - X_C) \sin \phi$ becomes negative and equals (in magnitude) $R \cos \phi$ so that DV becomes zero. The ratio X_C / X_L is called "compensation factor" and when expressed as a percentage is known ...

Capacitor principle and compensation calculation

A capacitor is constructed from two conductive metal plates 30cm x 50cm which are spaced 6mm apart from each other, and uses dry air as its only dielectric material. Calculate the capacitance of the capacitor. Then the value of the capacitor consisting of two plates separated by air is calculated as 0.221nF, or 221pF.

A capacitor is a device that stores energy. Capacitors store energy in the form of an electric field. At its most simple, a capacitor can be little more than a pair of metal plates separated by air.
