While we"ve discussed Ohm"s Law and series and parallel circuits, you"ve probably realized by now that there are many situations where these methods come short when trying to analyze a circuit. Gustav Kirchhoff was a German scientist who came up with two important laws that are the underpinning concept behind most network analysis.

So far, we have modeled circuits where the current does not change with time. When a capacitor is included in a circuit, the current will change with time, as the capacitor charges or discharges. The circuit shown in Figure (PageIndex{1}) shows an ideal battery 1 ((Delta V)), in series with a resistor ((R)), a capacitor ((C), two vertical bars) and a switch ((S)) that is open.

Transient Analysis of First Order RC and RL circuits The circuit shown on Figure 1 with the switch open is characterized by a particular operating condition. Since the switch is open, no current flows in the circuit (i=0) and vR=0. The voltage across the capacitor, vc, is not known and must be defined.

Mesh analysis is similar to nodal analysis in that it can handle complex multi-source circuits. In some ways it is the mirror image of nodal analysis. While nodal analysis uses Kirchhoff's current law to create a series of current summations at various nodes, mesh analysis uses Kirchhoff's voltage law to create a series of loop equations that can be solved for mesh currents.
