The so-called energy storage means that when the circuit breaker is de-energized (that is, when it is opened), it opens quickly due to the spring force of the energy storage switch. Of course, the faster the circuit breaker is opened, the better. This is to have enough power to separate the contacts when the segmentation fault has a large current (excessive current ...

When the contacts of the breaker are opened in the vacuum ( $10^{-7}$  to  $10^{-5}$  torr), an arc is produced between the contacts by the ionization of metal vapors of contacts.. However, the arc is quickly extinguished because the metallic vapors, electrons, and ions produced during arc rapidly condense on the surfaces of the circuit breaker contacts, resulting in a quick ...
