Product description: The battery simulator is a high-precision DC-DC regulated power supply with load function. It is equipped with linear power supply, and the input and output modes of each channel are two-wire or four-wire (differential four-electrode: V+, I+, V-, I-), and has the same charging and discharging function as real batteries.

A full-function battery simulator is in reality a power supply with the ability to sink and source current, using a special type of voltage supply that can operate in either two- or four-quadrants. In contrast, a conventional power supply can only source, but not sink, current and can only operate in the first quadrant.
