Power is seldom controlled. Power has two components. Electrical power from a battery is voltage multiplied by current. You can control voltage or current relatively easily, but it is difficult and generally not desirable to control both at the same time. Mechanical power from a motor is speed multiplied by torque.

So when the current is reaching a dangerous level, one must act quickly to reduce it back to acceptable levels. Controlling the Current Without an Ammeter. Using an ammeter built into the car battery charger is the best means to control the current because the ammeter gives a useful indication of the actual current flowing (see details below).
