Abstract: Lithium-sulfur (Li-S) batteries are expected to be one of the candidates for next-generation high-energy-density batteries because of their ultra-high theoretical energy density (2600 Wh \cdot kg⁻¹). However, it suffers from low sulfur utilization, rapid capacity fading, and the "lost effect" of lithium polysulfides (LiPSs).

(4) Higher theoretical energy densities, which means they have the potential to store more energy per unit weight or volume. (5) Excellent thermal stability at high temperatures. For instance, NCM811 is stable up to 750 \cdot C based on the materials, which is much higher than the typical operating temperature range for lithium-ion batteries [19], [20].
