What is the reactance of a 7.0mF capacitor connected to a 26 kV (rms), 640 Hz line? Express your answer using two significant figures. Determine the frequency and the peak value of the current. Express your answer using two significant figures. Express your answer using two significant figures.

I am going to draw about 20mA over a high resistance load for a short amount of time, around 20 to 50msec. It is okay if it takes the circuit a while to reach the 10kV output voltage, as to not draw too much current from the battery while charging the circuit. When discharging, the output current will be current limited to a maximum of 20mA.

Example of an energy-storage capacitor (50 kJ, 10 kV, peak current 60 kA, volumetric energy 600 J/l). Castor-oil-impregnated paper technology.

Let we calculate the required reactive power in kVAR or capacitor bank to be connected across the motor? Here, PF 1 = 0.7. PF 2 = 0.96. Required capacitor bank = $100 \times \tan (\cos^{-1} (0.7) - \cos^{-1} (0.96)) = 72.85 \text{ kVAR}$. Hence you can connect three 25kVAR capacitor bank across the panel for improving the power factor from

In a sense, shunt capacitors modify the characteristic of an inductive load by drawing a leading current that counteracts some or the entire lagging component of the inductive load current at the point of installation. Therefore, a shunt capacitor has the same effect as an overexcited synchronous condenser, generator, or motor.
