In a VSI, the DC link capacitor has two main responsibilities - Provide low impedance path for high frequency currents - As frequency goes up, the battery and cable parasitic inductance cause the impedance to increase. The DC link capacitor impedance goes down so it becomes the preferable path for high frequency AC to circulate.

Physical Dimension and Mounting Style are Factors in Capacitor Selection. The last but not the least to think about is the physical dimension as well as the mounting style. Sometimes capacitor selection is dictated by the space available. Chip capacitors has small footprints but with limited capacitance value.
