Typical solar cell output characteristics are illustrated in Fig. 20-25. Consider the characteristic for a 100 mW/cm² illumination level. If the cell is short-circuited, the output current (I_o) is 50 mA cause the cell voltage (V_o) is zero at this point, the output power (P_o) is zero.. Open-circuiting the cell gives $V_o = 0.55$ V, but $I_o = 0$. So, P_o is again zero.
