The speed of the vehicle also needs to be taken in account because when the vehicle is going to start, all the capacitor energy will be required. By contrast, when the vehicle run at high speeds (more than 80 km/h), the ultracapacitors need to be empty, to be able to receive the energy coming from a sudden emergency stop.

In electrical engineering, a capacitor is a device that stores electrical energy by accumulating electric charges on two closely spaced surfaces that are insulated from each other. The capacitor was originally known as the
