

Abstract: The paper represents the design of a 100 kW three-phase network inverter for a hybrid energy storage system based on batteries and supercapacitors. The presented design is based on fast IGBT switches, provides their effective cooling and can be performed in a modular design. The inverter is designed for

as: electrical energy storage systems, stationary lithium-ion batteries, lithium-ion cells, control and battery management systems, power electronic converter systems and inverters and electromagnetic compatibility (EMC). Several standards that will be applicable for domestic lithium-ion battery storage are currently under development

ElectroMagnetic Compatibility (EMC) is the discipline concerned with the analysis and design of systems which are electromagnetically compliant with each other, are able to sustain a certain amount of interference and in addition do not contribute undue amounts of EM energy to the environment (EM pollution). The maximum EM energy levels that ...

be capable of emitting EMI is the inverter. Inverters, however, produce extremely low frequency EMI similar to electrical appliances and at a distance of 150 feet from the inverters the EM field is at or below background levels. Also proper inverter enclosure grounding, filtering, and circuit layout further reduce EM radiation.

Classified of electromagnetic compatibility Electromagnetic compatibility (EMC) has long been regarded as a black magic approach in power electronics study [4]. The general classification of the EMC is presented in Fig. 1. Switching in the power electronics circuits causes EMI, which is proportional with the switching frequency.
