Battery lifetime is also a relevant parameter for choosing the storage system and is calculated through the number of battery charge and discharge periods; otherwise, it can be expressed as the total amount of energy that a battery can supply during its life. Finally, the safety parameter is important in determining the suitability of the battery for a particular use.

Capacitors used for energy storage. Capacitors are devices which store electrical energy in the form of electrical charge accumulated on their plates. When a capacitor is connected to a power source, it accumulates energy which can be released when the capacitor is disconnected from the charging source, and in this respect they are similar to batteries.
