To recap, you don't need to ground the solar panels in your RV but you absolutely have the option. Just run a ground wire from the solar panel frame to the chassis of your RV as close to the battery sub-bay as possible. While you're at it you can also ground other loads, like the charge controller or battery bank, to the same point.

The transformer doesn't consume energy until the lights are on. And your manufacturing quality also counts when it comes to energy consumption. Higher quality will often use less energy, even at a higher wattage than a lower quality unit. From what I found out, a standard 12 - 20 light system will use less energy than today's modern ...

You'll need the following things to ground your portable generator: Grounding Rod: A grounding rod is meant to be pushed into the ground so that any electrical current can safely flow away from it. Most portable generators need a copper rod that is at least four feet long. A longer copper rod can help you drive it deeper into the ground.

Propane tanks are inherently safe, whether buried underground (grounded) or situated above it, so it's not necessary to ground them. In terms of safety, underground propane tanks tend to be safer since the surrounding soil can absorb the gas in case of any leaks, which would just be released into the environment if the tank is located above ground.
