The energy transformation, resulting from internalizing the cost of CO 2 emissions, has led to a drastic transformation of the electricity generation system. Despite this, according to the International Energy Agency, the predominant position of fossil fuels in terms of the primary energy consumed on a global scale is still evident today.

1 Introduction. The growing worldwide energy requirement is evolving as a great challenge considering the gap between demand, generation, supply, and storage of excess energy for future use. 1 Till now the main source of the world"s energy depends on fossil fuels which cause huge degradation to the environment. 2-5 So, the cleaner and ...

Energy storage devices (ESD) are emerging systems that could harness a high share of intermittent renewable energy resources, owing to their flexible solutions for versatile applications from mobile electronic devices, transportation, and load-leveling stations to extensive power conditioning.

"The report focuses on a persistent problem facing renewable energy: how to store it. Storing fossil fuels like coal or oil until it's time to use them isn't a problem, but storage systems for solar and wind energy are still being developed that would let them be used long after the sun stops shining or the wind stops blowing," says Asher Klein for NBC10 ...
