storage system. This flywheel system integrates a homopolar inductor motor/alternator and a steel energy storage rotor to achieve high power density energy storage using low-cost materials. A six-step inverter drive strategy that minimizes inverter VA-rating and enables high frequency operation is also implemented.

energy is the energy generated by a motor when the motor operates. A servo drive uses internal regenerative processing circuits to absorb the regenerative energy generated by a motor when the motor decelerates to prevent the DC voltage from increasing. If the regenerative energy from the motor is too large, an overvoltage can occur.

The design, construction, and test of an integrated flywheel energy storage system with a homopolar inductor motor/generator and high-frequency drive is presented in this paper.
