A 1uF capacitor and a 10uF capacitor are other common ones seen in circuits. They do a good job of helping smooth out ripple noise in DC voltages. For super capacitors, a 1 Farad capacitor or even a 2 Farad capacitor is seen often on boards that need a little current even if the power goes out or the battery dies.

The unit for measuring capacitance is the farad (F), defined as 1 coulomb (C) of electric charge per volt (V) of potential difference. In practice, the farad is such a large unit that capacitance is usually measured in smaller units such as the microfarad, 1 millionth of a farad; or the nanofarad, 1 billionth of a farad.

OverviewDefinitionHistoryExplanationCGS unitsNotesExternal linksThe capacitance of a capacitor is one farad when one coulomb of charge changes the potential between the plates by one volt. Equally, one farad can be described as the capacitance which stores a one-coulomb charge across a potential difference of one volt. The relationship between capacitance, charge, and potential difference is linear. For example, if the potential difference across a capacitor is halved, the quantity of charge stored by that capacit...
