As you might remember from our article on Ohm's law, the power  $P$  of an electrical device is equal to voltage  $V$  multiplied by current  $I$ :  $P = V \cdot I$ . As energy  $E$  is power  $P$  multiplied by time  $T$ , all we have to do to find the energy stored in a battery is to multiply both sides of the equation by time:  $E = V \cdot I \cdot T$ . Hopefully, you remember that amp hours are a measure ...

If the meter shows more than 12.06 volts (up to 12.7 volts or higher) the battery will usually take a fresh charge. If the voltage is 11.75 volts to 12.06 volts, the battery might take a charge, but it's not in good shape. If the voltage is less than 11.75 volts, your battery may be at end of life, and should be replaced.

Technically the minimum amount of voltage for charging will be anything above the current state of charge. But that's probably not the answer you're looking for, from Lithium-ion battery on Wikipedia:.. Lithium-ion is charged at approximately 4.2 &#177; 0.05 V/cell except for &quot;military long life&quot; that uses 3.92 V to extend battery life.
