

How much electricity can container energy storage batteries store

Solar battery costs have fallen by 97% since 1991, according to Our World In Data. That means the same 5kWh lithium-ion battery that now costs you $\$2,000$ to install at the same time as a solar panel system would've set you back $\$66,700$ in 1991.

Domestic battery storage is a rapidly evolving technology which allows households to store electricity for later use. Domestic batteries are typically used alongside solar photovoltaic (PV) panels. But it can also be used to store cheap, off-peak electricity from the grid, which can then be used during peak hours (16.00 to 20.00).

Without battery storage, a lot of the energy you generate will go to waste. That's because wind and solar tend to have hour-to-hour variability; you can't switch them on and off whenever you need them. By storing the energy you generate, you can discharge your battery as and when you need to.

The PCS also works in reverse, converting AC power from the grid or a renewable energy source into DC power that can be stored in the batteries. In essence, the PCS serves as the bridge between the BESS and the external power system, ensuring that power can flow in either direction as needed. ## Energy Management System (EMS)
