You'll need to add an on/off switch between the battery and the module. The voltage module draws power even when not in use and adding a switch between the battery and module will ensure the power isn't drained. When you charge the battery you need to make sure that the module is "on" or it won't charge. STEPS: 1.

This is several questions and should probably be broken apart, but nevertheless. According to this TP4056 datasheet, a 1.2 k Ω R PROG will give a charging current between 950 and 1050 mA. This is a bit much for a lithium-ion battery, which typically prefers a charging current no more than 1 C (e.g. 900 mA for a 900 mAh battery).
