**Solar Panels and Their Power.** A solar panel is a device that converts sunlight into electricity. Solar panels are most often used to power homes, streetlights, and remote phone towers. A typical solar panel can produce about 2 watts of power per hour on an average day in the U.S., even if it's cloudy outside.

Once you connect the solar panels to the inverter, the device changes the solar power into electricity that your house can use. **Connecting to Your Home:** The inverter then connects to your home's power system. This lets the electricity from your solar panels power your lights, fridge, TV, and other things in your house. **Grid Connection (Optional):**

On the other hand, standby generators connect to your home's electrical panel and kick on automatically when the power goes out. Generators run on fuel to keep your electricity on during an outage ...

However, if you are switching entirely to the solar power, you will have to purchase and install batteries that store the solar power for use at night. **Step 3.** Connect the solar panels either directly to a power inverter and then connect it to the home grid, or connect the inverter to the battery and then to the home power grid.

**Line Or Supply-Side Connection.** Connecting solar panels to the grid can be done through a line or supply-side connection. This involves connecting the solar panels directly to the main electrical supply of your home. As a result, the solar panels' electricity can power your home's appliances and other devices.
