Energy Storage: The accumulation of charge on the plates creates an electric field between them. This electric field stores electrical energy in the capacitor. The amount of charge the capacitor can store is determined by its capacitance, which is measured in farads (F). Higher capacitance means the capacitor can store more charge for a given ...

However, this is limited in low impedance applications. In the case of low impedance circuits, the capacitor is likely to be stressed by current surges. Derating the capacitor increases the reliability of the component. [...] In circuits which undergo rapid charge or discharge a protective resistor of $10/V$ is recommended.

Diode D1 pushes the DC bias on the capacitors so that the negative peak is 0V or more, and D2 pushes it so that the positive peak is 200V or less. When C3 is at less than 200V, then the circuit acts like a charge pump and each cycle will add a little charge onto C3. How much depends on the absolute value of the capacitors and the cycle frequency.

Thus charge of a capacitor is directly proportional to its capacitance value and the potential difference between the plates of a capacitor is measured in coulombs. One coulomb: One coulomb of charge on a capacitor can be defined as one farad of capacitance between two conductors which operate with a voltage of one volt.

rectifier are damaged. Only roads and rectifier are damaged, other parts are not damaged. I think it's because the capacitor is charging very fast and therefore sudden high current flow. What can be done to slow charge the capacitor?

\$begingroup\$ @ammarx The rate at which the capacitor charges or discharges is the amount of current flowing through it. When the input voltage is switched high this current is limited by the 100k resistor and as it charges the voltage across the resistor falls so less current flows and the capacitor charges more slowly.

The charging circuit here uses an ATtiny13A and a MP18021 half-bridge gate driver to charge the capacitor, and also is programmed in a way that allows for three steps for charging the capacitor.
