When we connect N-number of solar cells in series then we get two terminals and the voltage across these two terminals is the sum of the voltages of the cells connected in series. For example, if the of a single cell is 0.3 V and 10 such cells are connected in series than the total voltage across the string will be  $0.3 \text{ V} \times 10 = 3 \text{ Volts}$ .

Fig. 13 compares the evolution of the energy storage rate during the first charging phase. The energy storage rate  $q_{sto}$  per unit pile length is calculated using the equation below:  $(3) q_{sto} = m \cdot c_w \cdot T_{in\text{ pile}} - T_{out\text{ pile}} / L$  where  $m$  is the mass flowrate of the circulating water;  $c_w$  is the specific heat capacity of water;  $L$  is the ...
